Task Modality	Overall Effect Size ^b	95% Confidence Interval
Phonological	0.68 ^c	0.49 – 0.87
Visuospatial	0.32 ^c	-0.02 – 0.66

Note. All studies were between-group comparisons of ADHD and healthy control adults. ADHD = attention-deficit/hyperactivity disorder; CANTAB = Cambridge Neuropsychological Test Automated Battery; HC = healthy/normal control; KABC-II = Kaufman Assessment Battery for Children-Second Edition; PH = phonological; VS = visuospatial; WAIS = Wechsler Adult Intelligence Scale; WMS-R = Wechsler Memory Scale-Revised; WRAML = Wide Range Assessment of Memory and Learning.

^aPositive effect size reflects poorer performance (lower accuracy or greater errors) by the ADHD group.

^bThe overall effect size estimates are likely biased by the inclusion of multiple data points from the same sample (i.e., multiple tasks from the same study) which overweights findings from a sample and risks threats to statistical independence.

^cThe PH and VS effect sizes obtained from excluded task/conditions were not significantly different from the overall effect sizes reported in the study.
