

**Supplemental Appendix**  
**Additional Information and Results for Orquin, Lahm, and Stojic (2021)**

**Table A1**

*Eye-Tracker Specifications Table, With Accuracy and Precision for Each Eye-Tracker as Extracted From the Manufacturer Website, and Computed Artifact Multiplier Used for Correcting for a Bias in Effect Size Estimates*

Eye-tracker model	$a_a$	Accuracy	Precision
ASL6000	0.5523	1.00	0.50
EasyGaze	0.6866	0.70	0.35
Eye gaze 97	0.6794	0.72	0.50
Eye gaze tm	0.8209	0.40	0.50
EyeLink 1,000	0.7762	0.50	0.05
EyeLink 1,000 (acc = .33)	0.8523	0.33	0.05
EyeLink 1,000 Plus (acc < .5)	0.7762	0.50	0.05
EyeLink II	0.7762	0.50	0.01
ISCAN	0.5523	1.00	0.50
Nihon-Kohden EEG-1,100	0.5523	1.00	0.50
SMI Glasses	0.4583	1.21	0.19
SMI RED	0.8209	0.40	0.03
SMI iView	0.7762	0.50	0.01
SMI iView HED	0.5523	1.00	0.50
SMI model unknown (acc < .5)	0.7762	0.50	0.30
Tobii D10	0.7762	0.50	0.50
Tobii Glasses 1	0.3643	1.42	0.50
Tobii T120	0.8209	0.40	0.24
Tobii T1750	0.7762	0.50	0.25
Tobii T2150	0.7762	0.50	0.35
Tobii T60	0.7762	0.50	0.22
Tobii X1	0.7762	0.50	0.20
Tobii X2	0.8209	0.40	0.32
Tobii X60	0.7762	0.50	0.30
Tobii glasses 2	0.3643	1.42	0.34
Unknown	0.6919	0.69	0.30

Note.  $a_a$  = artifact multiplier; ASL = Applied Science Laboratories; SMI = SensoMotoric instruments.

**Table A2**

*Metric Correction Factor  $A_m$  When Correcting to Either Fixation Count or Fixation Likelihood—These Correction Factors Were Used to Make Sure All Dependent Variables Are Comparable*

Correcting from	Correcting to	$A_m$
Fixation count	Fixation likelihood	1.041
Fixation likelihood	Fixation count	0.961
Total dwell time	Fixation likelihood	0.913
Total dwell time	Fixation count	1.035
Dwell count	Fixation likelihood	0.844
Dwell count	Fixation count	0.957

**Table A3***Overview of Individual Effect Sizes*

Note. IV = independent variable (LvR = left vs. right position, Center = center position, Sal = salience, Pref = preferential viewing, Choice = choice-gaze effect, Task = task instructions); N = number of participants;  $a_a$  = artifact multiplier; r = attenuated effect size correlation expressed in the fixation count metric; Domain = research domain (Pref Con = preferential consumer choice, Pref Non-Con = preferential nonconsumer choice, Inf Con = inferential consumer choice, Inf Non-Con = inferential non-consumer choice, Lotteries = risky gambles); Alt/Att = alternative or attribute manipulation; SMI = SensoMotoric instruments.

\*accuracy = 0.33 of visual angle.

**Table A4**

Attribute	16 (2)	1,273 (468)	0.34 (0.28)	0.06 (0.1)	5.32 (2.67)	<.001 (.008)	0.2 (0.07)	0.48 (0.48)	64.64 (68.33)
<i>Preferential viewing</i>									
Alternative	7 (2)	600 (385)	0.61 (0.29)	0.19 (0.08)	3.17 (3.64)	.034 (<.001)	0.08 (0.13)	1.13 (0.45)	76.81 (0)
Attribute	17 (2)	2,033 (688)	0.31 (0.31)	0.08 (0.13)	3.95 (2.43)	.002 (.015)	0.14 (0.06)	0.47 (0.55)	77.03 (86.6)

Note. *k* = number of studies; *N* = number of participants;  $\rho$  = unattenuated effect size estimate; *SE* = standard error of estimate; *Z* = *Z* statistic; *p* = significance level;  $CI_{LL}^{95}$  = lower limit of the 95% confidence interval;  $CI_{UL}^{95}$  = upper limit of the 95% confidence interval;  $I^2$  = within-group heterogeneity. The most important values are the corrected effect size estimate,  $\rho$ , and the associated heterogeneity,  $I^2$ . Results of the Top10 analysis are in parentheses.

**Table A6**

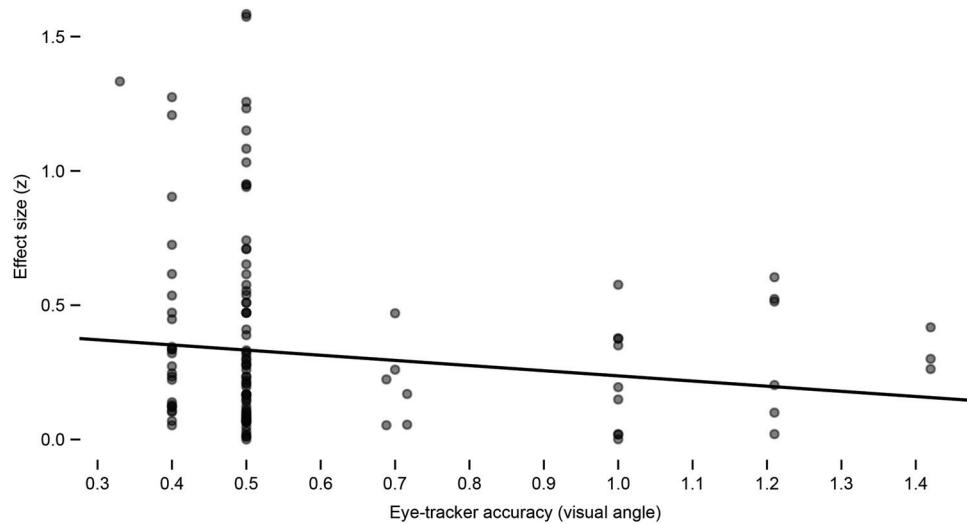

Publication Bias Analysis With Precision-Effect Test (PET) and Precision-Effect Estimate Test (PEESE) of Complete Data

Parameter	$\beta$	SE	$t$	$df$	$p$
PET					
Intercept	0.169	0.102	1.651	1.505	.279
$SD$	2.156	0.622	3.468	8.888	.007
$A$	-0.118	0.156	-0.753	3.01	.506
PEESE					
Intercept	0.23	0.098	2.355	1.627	.171
$Var$	5.598	1.886	2.969	12.94	.011
$A$	-0.001	0.172	-0.004	2.417	.997

Note. See Method for details on the tests.

**Figure A1**

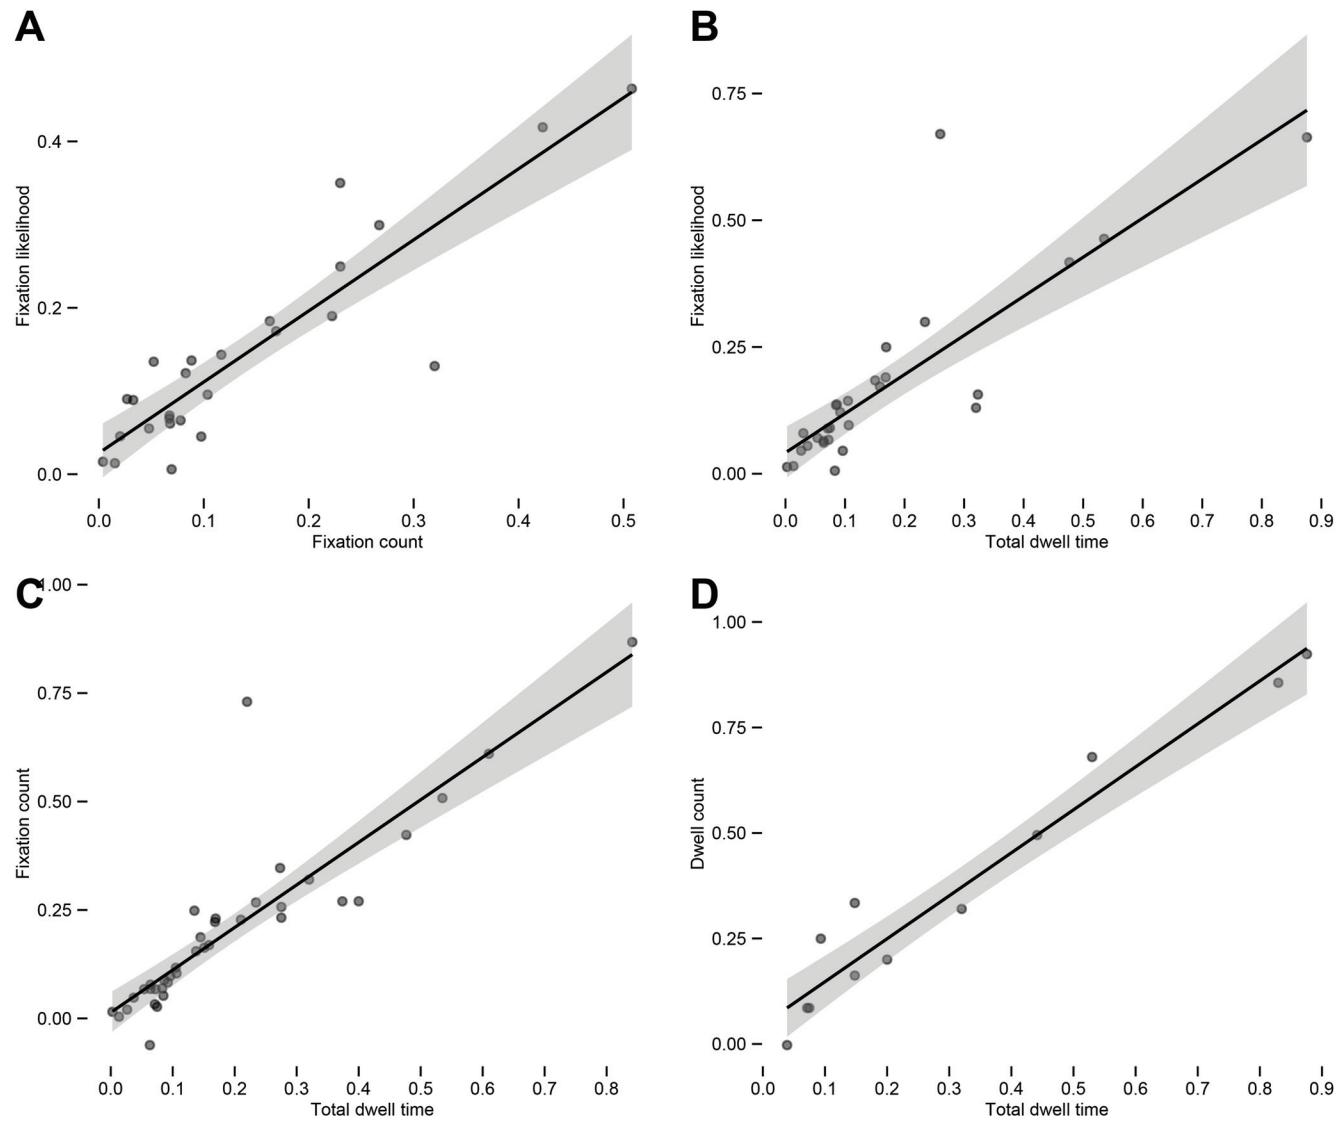

Accuracy of the Eye-Tracker Affects the Ability to Reliably Measure Effect Sizes in Each Study

Note. Points denote the accuracy of an eye-tracker used in a study and the effect size measured with it. The line is based on the estimated intercept and slope from the best-fitting mixed-effect model, which was used to compute artifact multiplier,  $a_a$ . The multiplier was used to correct for a bias in estimated effect sizes attributable to differences in measurement accuracy of eye-trackers.

**Figure A2**

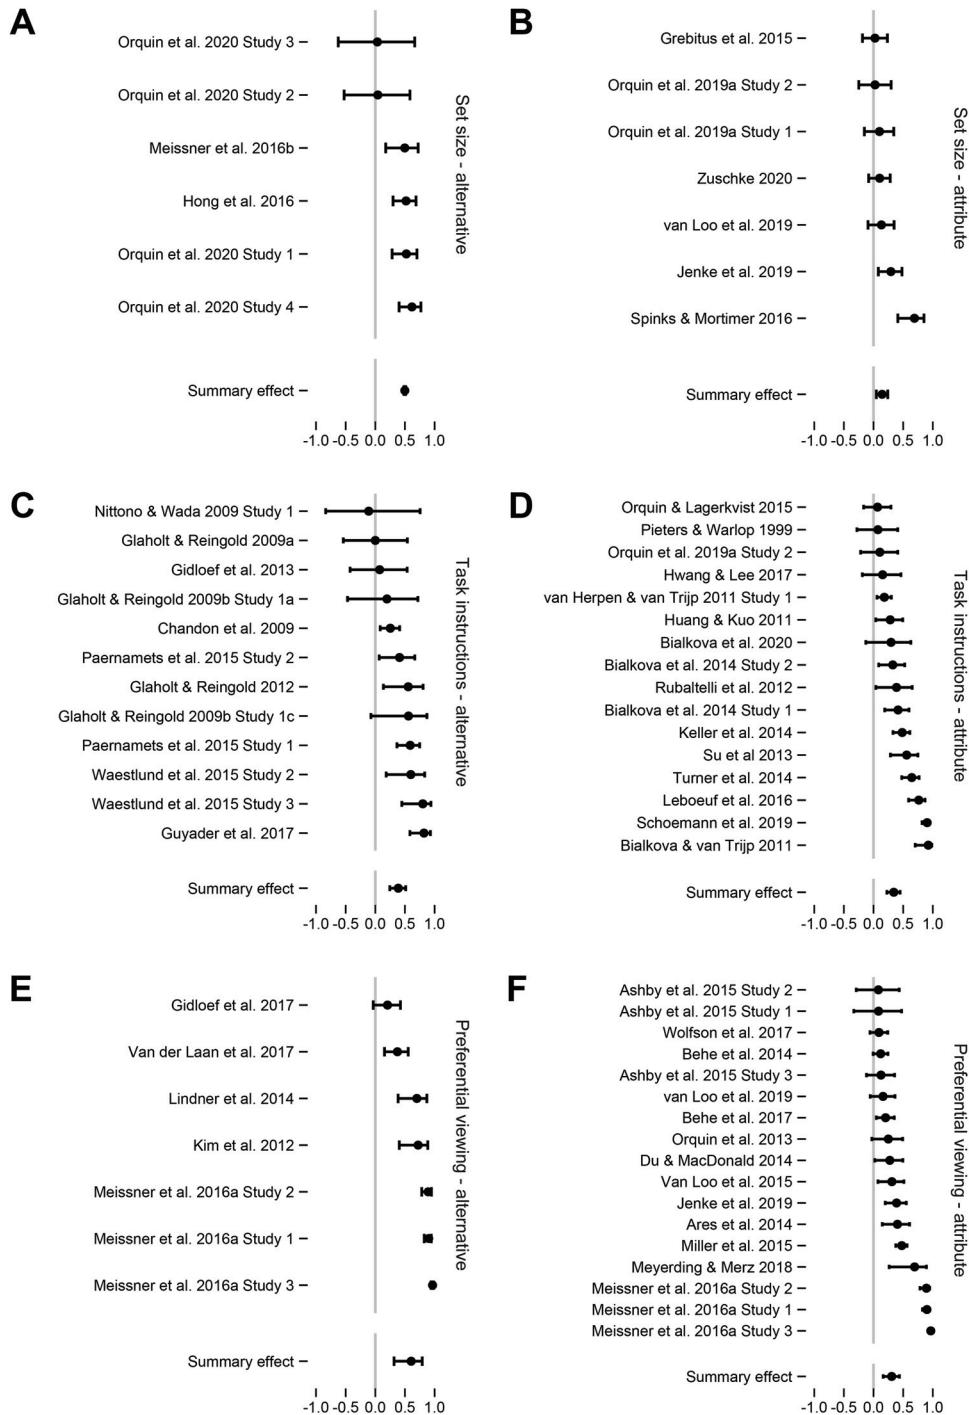

Several Eye Movement Metrics Are Used as Dependent Variable, but They Are All Highly Correlated, Suggesting They Are All Measuring the Same Underlying Construct

*Note.* Scatterplots show the relationship (A) between effect sizes expressed in fixation likelihood and fixation count, (B) between total dwell time and fixation likelihood, (C) between total dwell time and fixation count, (D) between total dwell time and dwell count. Lines in each plot represent the best-fitting linear regression line, and the shaded area 95% confidence interval.

**Figure A3**

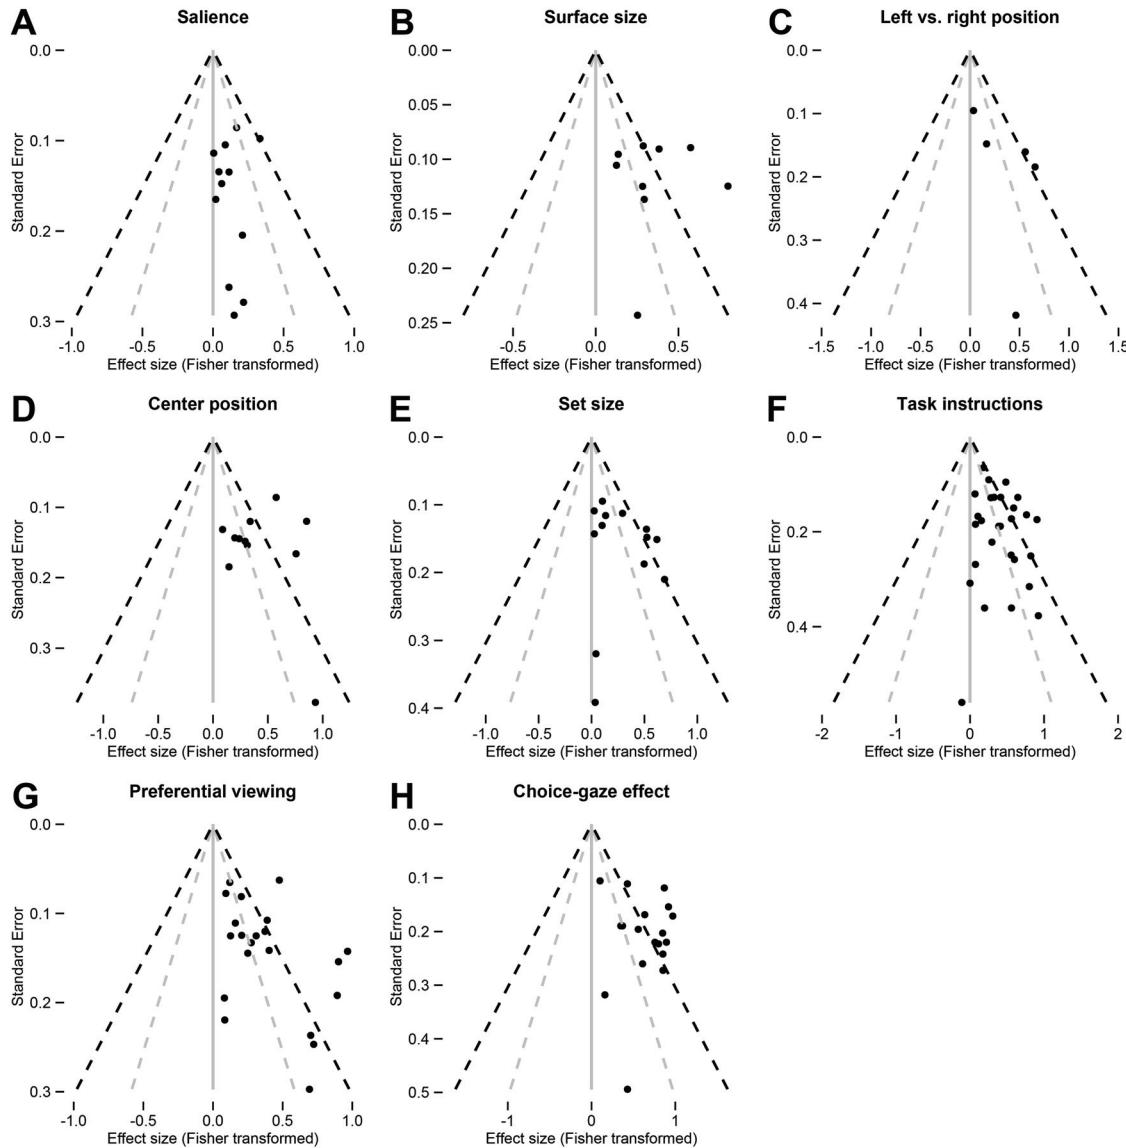

*Effect Sizes of the Factors That Were Decomposed Into Alternative and Attribute Parts for Moderator Analyses*

*Note.* Forest plots show the unattenuated effect size correlations for each study in a group, as well as average effect across the group. Forest plot in (A) shows the effect sizes for set size – alternative, in (B) for set size – attribute, in (C) for task instructions – alternative, in (D) for task instructions – attribute, in (E) for preferential viewing – alternative, and in (F) for preferential viewing – attribute. Error bars represent the 95% confidence interval around the mean.

**Figure A4**

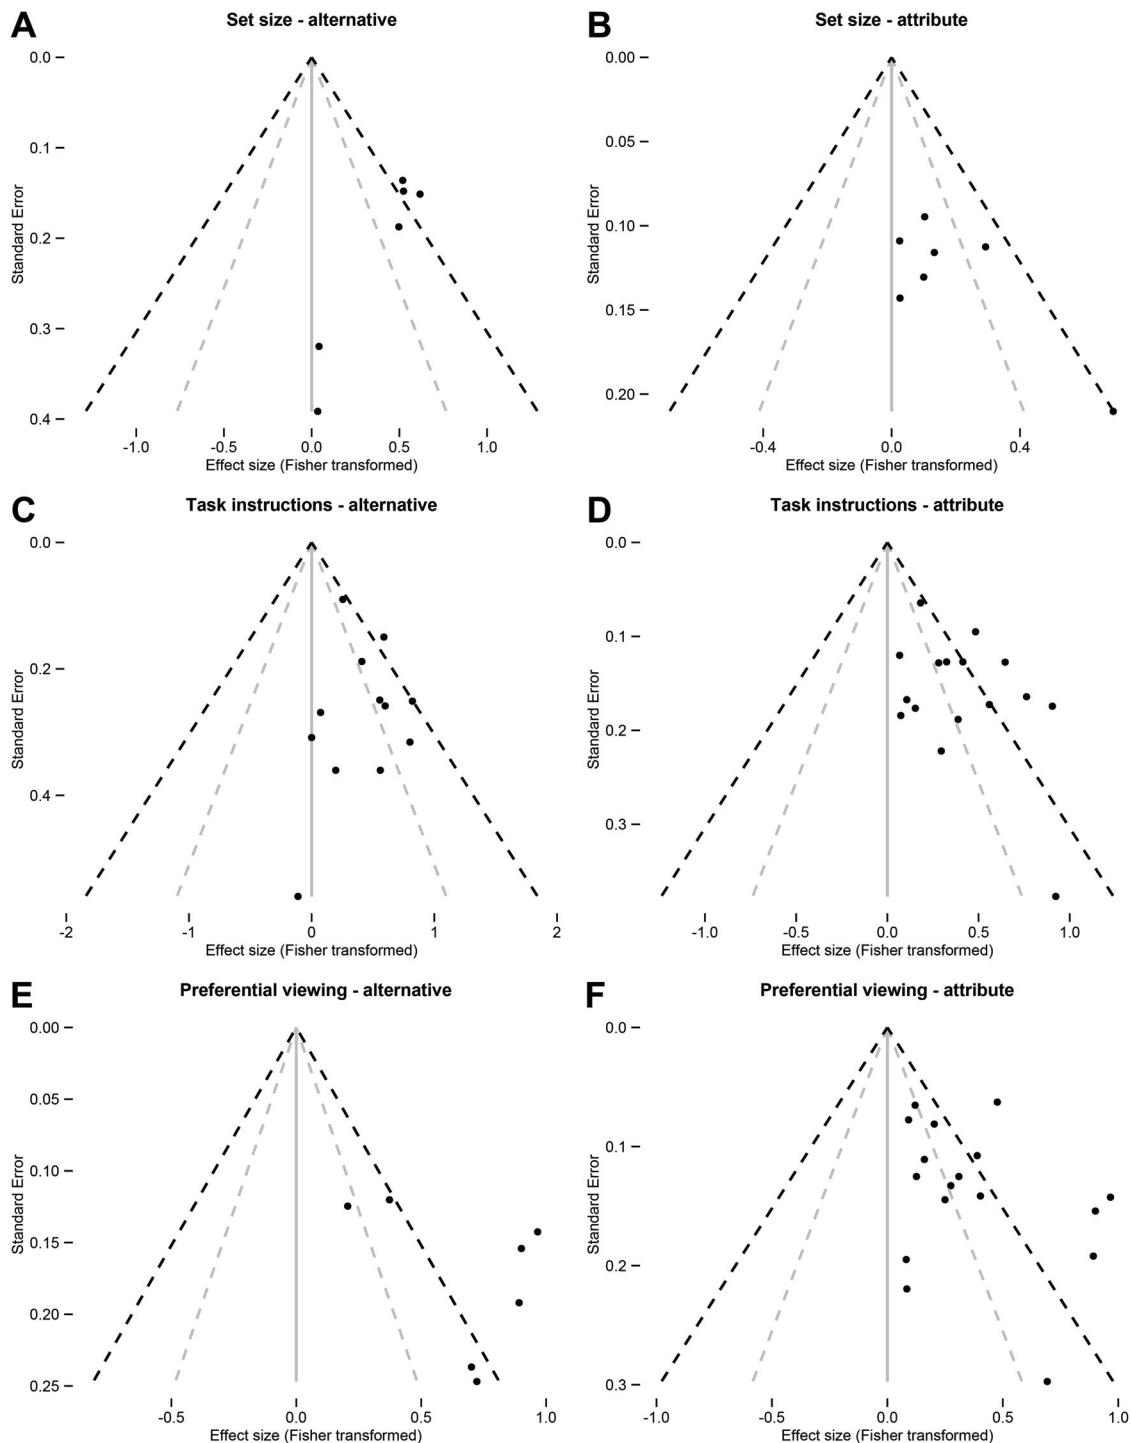

*Funnel Plots for Each Factor That Can Be Used as a Qualitative Check of a Publication Bias*

*Note.* Points are Fisher transformed correlation coefficients against their standard error. Asymmetric distributions of points can indicate the presence of publication bias because smaller studies (those with higher standard errors) have more variable effect sizes and are less likely to be published unless the effect is large. The gray dashed line indicates the region Funnel plot for (A) salience, (B) surface size, (C) left vs. right position, (D) central position, (E) set size, (F) task instructions, (G) preferential viewing, and (H) choice-gaze effect.

**Figure A5**

*Funnel Plots for Factors That Were Decomposed Into Alternative and Attribute Parts for Moderator Analyses*

*Note.* Points are Fisher transformed correlation coefficients against their standard error. Asymmetric distributions of points can indicate the presence of publication bias since smaller studies (those with higher standard errors) have more variable effect sizes and are less likely to be published unless the effect is large. Funnel plot for (A) set size – alternative, (B) set size – attribute, (C) task instructions – alternative, (D) task instructions – attribute, (E) preferential viewing – alternative, (F) preferential viewing – attribute.
