Supplemental Online Material 2: Excluded articles

The term "core belief" is used in many different ways. Four exclusion criteria were used (see review protocol in the main document) according to the definition of self-related core beliefs used for the present study. In the following, representative examples illustrate the diverse use of the term and, at the same time, set the boundaries for the construct that is investigated in the present study. The review is organized around the four exclusion criteria and numbered accordingly.

(1) Some postulated core beliefs are not pure core beliefs, but also contain emotions, motivation, and behavior (Leary, 1983; Terjesen et al., 2009; Thimm & Chang, 2022). This is particularly true for core beliefs developed in the context of schema therapy (Keyfitz et al., 2013; Levinson et al., 2017; Louis et al., 2018; Rodebaugh, 2009; Young, 2005). While schemas are conceptualized more broadly than core beliefs, their main point is about cognition. Given the rich and detailed literature on schemas, they were considered as partly fulfilling the inclusion criteria and being thoroughly checked or modified on the item-level.

(2) Individuals hold core beliefs not only relating to themselves in their social context, but also relating to other people, groups, organizations, domains, or the world in general, which were not considered in the present review. For example, beliefs may reflect how others are in general, such as "I believe that in general, people get what they justly deserve" (Dalbert et al., 1987) or "Others are unforgiveable" (Fowler et al., 2006). Core beliefs have also been specified to describe groups of people according to their professions, such as for leadership (Jacobs, 2017), management (Woods & Joyce, 2003), coaches (Abravanel & Gavin, 2017), pathologists (Jenkins et al., 2002), sex workers (Huber et al., 2019), rehabilitation service workforce (Mills et al., 2021), or teachers (Miller, 2015). Also, core beliefs were proposed as pertaining to organizations (Cascio, 2006; Janson et al., 1997), like in the form of mission statements. Also excluded were approaches on core beliefs that pertain to a specific domain. These beliefs refer to a certain object and overlap with the concept of attitudes. For example,

beliefs may relate to domains such as policy, religion, medicine, education, or the environment (e.g., "The balance of nature is very delicate and easily upset"; Dunlap & Van Liere, 1978, p. 21). Also excluded were beliefs about the world, rather than the self. As such, beliefs have been researched as worldviews (Nilsson, 2014b), reflecting beliefs in domains such as metaphysics, epistemology, human nature, or morality (Nilsson, 2018). Others considered beliefs of the world as a dangerous place or as a competitive jungle (Duckitt et al., 2002) or the belief in a just world (e.g., "I believe that in general, people get what they justly deserve"; Dalbert et al., 1987). Clifton et al. (2019) identified 26 so called primal world beliefs via textual analysis which were aggregated into the three domains safe, enticing, and alive (e.g., "On the whole, the world is an uncomfortable and unpleasant place"; p. 88).

(3) The term core belief is also used for beliefs that are not basic and generalized, but rather relating to specific situations, aspects of the self, events, persons, or domains. (3a) Core beliefs relating to specific situations include disorder-specific beliefs from clinical psychology such as relating to auditory hallucinations ("I am being punished for having killed someone"; Birchwood & Chadwick, 1997; Chadwick & Birchwood, 1994) or obsessive-compulsive disorder (e.g., "I believe the door handle is dirty, even though I cannot see the dirt"; O'Connor & Robillard, 1995), including thoughts about controllability (Steketee et al., 2011). In the social-cognitive literature, especially the theory of planned behavior, specific beliefs (e.g., going to the beach would be developing skin cancer; Ajzen, 1991) are assumed to influence behavioral, attitudinal, normative and control beliefs, which in turn are predictors of behavior intentions (Ajzen, 1985). Also, perceived behavioral control is not conceptualized as generalized locus of control, but rather as availability of requisite opportunities and resources (e.g., time, money, skills, cooperation of others) regarding a specific behavior such as donating for the red cross or using condoms (Fishbein & Ajzen, 2005). Another example includes research on theory of mind, which describes the ability of primates to represent what other people think or believe and involves recognizing that beliefs that others hold may be

false, as investigated in the false belief task (Baroncohen et al., 1985; Dennett, 1978; Grosse Wiesmann et al., 2017). Here, beliefs relate to current state of knowledge of an agent (e.g., does the cat think that the mouse is in the left or in the right box?).

(3b) Some approaches considered core beliefs only regarding specific aspects of the self. This includes cognitions about one's own thoughts such as considered in mentalizing (e.g., "I don't always know why I do what I do"; Fonagy et al., 2016), metacognition (e.g., "I do not trust my memory"; Wells & Cartwright-Hatton, 2004), rumination (e.g., "I think about many problems without solving any of them"; Ehrling et al., 2011, p. 231), self-concept clarity (e.g., "My beliefs about myself often conflict with one another."; Campbell et al., 1996, p. 145), or self-concept-stability (Block, 1961; Hogan, 1986; O'Brien & Epstein, 1988; Rosenberg, 1965). A second area relates to one's own emotions, such as relating to controllability, usefulness, regulation of emotions (Becerra et al., 2020; Ford & Gross, 2019; Veilleux et al., 2015), or attitudes towards emotions (Harmon-Jones et al., 2011), such as "Positive emotions are harmful" (Becerra et al., 2020; p.11). Also excluded were core beliefs related to specific symptoms, as proposed for phobias, epilepsy, eating disorders, addiction, or panic disorder, among others (see also France et al., 2015; e.g., "I am going to have a heart attack"; Greenberg, 1989; Hinrichsen, 2004; Hinrichsen et al., 2006; Hinrichsen et al., 2007; Hinrichsen et al., 2004; Martinez-Gonzalez et al., 2016; Pratt et al., 2004; Tedman et al., 1995; Tison et al., 2009). Other approaches focused on specific aspects of one's own appearance (Cash & Labarge, 1996; Gould et al., 2004; Obonsawin et al., 2017), perceptions of weight and eating (Carrard et al., 2017), the malleability of personality traits (Dweck, 2012); beliefs about one's own cognitive distortions (de Oliveira et al., 2015), and self-accusations (de Oliveira, 2011; de Oliveira et al., 2016).

(3c) Some core beliefs are considered according to specific events. In the stress literature (Lazarus & Folkman, 1984), core beliefs are conceptualized as appraisals of an event, such as producing threat and loss as opposed to opportunity for growth, mastery and

gain (Ferguson et al., 1999). Other approaches focus specifically on responses to traumatic events, such as intrusive thoughts, nightmares, imagery or "stuck-points" (Botsford et al., 2019; Christianson & Marren, 2012; Weiss & Marmar, 1997). Others focused on changes in core beliefs due to a traumatic event (Berntsen & Rubin, 2006; Mechanic & Resick, 1993; Milman et al., 2022; Vogt et al., 2012), some with a special focus on post-traumatic growth (Cann, Calhoun, Tedeschi, Kilmer, et al., 2010; Cann, Calhoun, Tedeschi, & Solomon, 2010; Lindstrom et al., 2013; Taku et al., 2021; Tedeschi et al., 2007; Triplett et al., 2012).

(3d) Core beliefs relating to specific persons were mainly investigated in the attachment literature (Bowlby, 1969; Bowlby, 1977; Bowlby, 2005; Platts et al., 2002), relating to one or both parents (e.g., "I feel uncomfortable getting too close to my mother", Asendorpf et al., 1997; see also Sheffield et al., 2005) or close friends (Armsden & Greenberg, 1987). If possible, these core beliefs were adjusted such as reflecting cognitions about others in general.

(3e) The largest body of literature on core beliefs that was excluded from the review refers to core beliefs that pertain to a specific domain. These beliefs refer to a certain object and overlap with the concept of attitudes. Domain-specific beliefs may relate to domains such as policy, religion, environment, medicine, or education. For example, the term core beliefs is used in policy science as "fundamental policy positions concerning the basic strategies for achieving core values within the subsystem" (Sabatier & Jenkins-Smith, 1999, p. 133). These include beliefs relating to racism, antiblack stereotyping, authoritarianism, anti-Semitism, ethnicity, punishment and imprisoning, conflict and war, abortion, the justice system, or multiculturalism (Altemeyer, 1996; Alvarez & Brehm, 1995; Anahit, 2014; Bandes & Feigenson, 2020; Bernardo et al., 2019; Beus & Dunlap, 1990; Cooper, 2005; Eisenberg, 2020; Ripberger et al., 2014; Sabatier, 1988; Stein, 2015; Tinc et al., 2021; Vilarroya & Hilferty, 2013; Waller et al., 2001). In the domain of ecology, core beliefs relating to alternative agriculture (Beus & Dunlap, 1990), regenerative energy, such as relating to wind energy (Wolsink, 2012),

extinction of species (Oriordan, 1995), or environmentalism (Dunlap & Van Liere, 1978) were considered (e.g., "The balance of nature is very delicate and easily upset"; Dunlap & Van Liere, 1978, p. 21).

In the domain of religion, core beliefs refer to an interpretative structure through which individuals view their life events and frame their experiences in the context of spirituality and illness (Bell & Wright, 2015; Campbell & Golan, 2011; Chambers & Nosco, 2015; Vickers, 2010; Wright & Bell, 2009), such as beliefs that suicide is not a viable solution to problems; believes in life after death; being spiritually oriented; being close to a powerful spiritual force; or being close to god (Batson et al., 1993; Daaleman et al., 2001; Daaleman & Frey, 1999; Greening & Stoppelbein, 2002; Krumrei et al., 2013; Rosmarin, Pirutinsky, Auerbach, et al., 2011; Rosmarin, Pirutinsky, & Pargament, 2011). Core beliefs in education include, on one hand, beliefs of teachers (Rissanen et al., 2018; Williams & Klamen, 2006), including assumption about the importance of curriculum materials (Taylor, 2016), beliefs about the learning process (e.g., are there right and wrong answers in child care?, Brownlee et al., 2009), moral and ethical principles in teaching (Santoro & Morehouse, 2011), and internationality (Tate, 2013); on the other hand beliefs of learner, such as beliefs about reactions of others in the classroom (Aragao, 2011) or during public speech (Hofmann & Dibartolo, 2000p. 15), about disability and sexual orientation (Morgan et al., 2011), epistemological beliefs (Kapucu & Bahçivan, 2015), and attitudes towards the study matter (Ohlsson, 2009; Phipps & Borg, 2009; Samarapungavan & Wiers, 1997; Zeidler, 1997).

Core beliefs investigated in the domain of medicine and healthcare took different perspectives. Some approaches focused on the core beliefs of health care professionals, including method of treatment (anti-aging medicine; Fishman et al., 2010; such as biopsychosocial vs. biomedical; Nijs et al., 2013), illnesses (Yang et al., 2016), or work ethics (Nathaniel, 2006). Others focused on core beliefs of patients, such as beliefs relating to medication intake (Demyttenaere, 2001), vaccine skepticism (Browne, 2018), organ donation

(Irving et al., 2012; Liu et al., 2015), illness per se (e.g., "Illness is a part of life"; Arestedt et al., 2015), complementary and alternative medicine (Goldstein, 2002), treatment methods (Cottrell et al., 2013; Meyer et al., 2013; Weitlauf et al., 2010), or exercising (Bosley et al., 2021). Additionally, core beliefs of relatives of patients, such as relating to obligations of family members, were considered (Giles-Sims & Lockhart, 2005).

In the organizational literature, core beliefs relating to work safety (Tinc et al., 2021), work ethics (Cromptley & Millward, 2009), leadership (Caldwell et al., 2002), vocational choice (Maggiori et al., 2017; Savickas & Porfeli, 2012), justice (Primeaux et al., 2003), team building (Crace & Hardy, 1997) or organizational change (Frances, 1995) were considered.

Finally, to illustrate the diversity of approaches, core beliefs have been proposed in the context of social virtual worlds (Merikivi et al., 2013), cultural differences (Hill et al., 2010; Schneider, 1998), violence criminals (Crooks et al., 2007; Dempsey & Day, 2011), or philosophy (Gheaus, 2018; McWilliams, 2016). The term core beliefs has been used as a synonym to zeitgeist, for example in architecture (Roshko, 2018), for a theoretical position, for example in philosophy (Molodet-Jitea, 2019), or for a point of view, for example in mathematics (Tennant, 2018). Highly specific core beliefs concern beliefs about the core of the earth (Jephcoat & Refson, 2001) or the constitution of a color (Roberts, 2020; Roberts & Schmidtke, 2019).

(4) As core beliefs are conceptualized as relative stable, conceptualizations as rather transient states were excluded (e.g. "This is super"; "Something has to change"; Hollon & Kendall, 1980, p. 597). This includes the concept of schema modes, moment-to-moment emotional and cognitive states and coping responses that are active at a given point in time (Goddard et al., 2022; Lobbestael et al., 2010; Young et al., 2007). Similarly, approaches were excluded which used the term as a synonym for having an idea or hypothesis (Bosworth, 2012).

Supplemental Online Material 3: List of dimensions identified through the literature

review

Measure	Dimensions	Inclusion
ABS2-SF	Attitude and Belief Scale 2 - Short Version	
	Irrationality - Catastrophizing	included
	Irrationality - Demandingness	included
	Irrationality - Frustration Intolerance	included
	Irrationality - Self-Downing	included
	Rationality - Frustration Tolerance	included
	Rationality - Preference	included
	Rationality - Realistic Evaluation of Badness	included
	Rationality - Self-Acceptance	included
ASAP	Assessment of Schema Adaptability Profile	
	Deserving	included
	Unworthy	included
	Entitled	included
	Reasonable standards	included
	Lack of standards	included
	Excessive standards	included
	Balanced perspectives	included
	Self-centred	included
	Other-centred	included
	Balanced self-view	included
	Inferior self-view	included
	Overinflated self-view	included
	Attention-comfortable	included
	Attention-avoidant	included
	Attention-seeking	included
	Secure attachment	included
	Anxious attachment	included
	Avoidant attachment	included
	Comfortable expression	included
	Excessive expression	included
	Emotion avoidance	included
	Interdependent	included
	Help-seeking	included
	Help-avoidant	included
	Reasonable self-indulgence	included
	Anhedonic	included
	Hedonistic	included
	Adaptive guilt	included
	Excessive guilt	included
	Minimal guilt	included
ATQ	Automatic Thought Questionnaire	
	Automatic Thoughts	included
BCSS	Brief Core Belief Scale	

Negative-Self	included
Positive-Self	included
Negative-Other	excluded
Positive-Other	excluded
BSCS Brief Suicide Cognition Scale	
Suicide Cognitions	included
CBQ Core Belief Questionnaire	
Negative Core Beliefs	included

	Intolerance of uncertainty	included
LoC Locus of Control		
	Internality	included
	Powerful Others	included
	Chance	included
LoC Locus of Control		
	internal locus of control	included
	external locus of control	included
MIBS Maladaptive Interpersonal Beliefs Scale		
	Interpersonal beliefs	included
NCB Negative Core Beliefs Inventory		
	negative core beliefs about others	included
	self-helpless-inferior	included
	self-helpless-vulnerable	included
	self-unloved	included
	self-worthless	included
NfC Need for control		
	Need for Control	included
OBQ Obsessive Beliefs Questionnaire (OBQ)		
	importance of thoughts/control of thought	included
	perfectionism/intolerance of uncertainty	included
	Inflated responsibility for harm	included
	overestimation of threat	included
OFS Openness to the Future Scale		
	Openness to the Future	included
PBI Personality Belief Items		
	Agreeableness - Arguing is good	excluded
	Agreeableness - Be agreeable to be liked	included

Agreeableness - Do it to them before they do it to you	excluded
Agreeableness - I am mistreated	included
Agreeableness - It's important to be liked	included
Agreeableness - It's important to be right	excluded
Agreeableness - Other people aren't worthy of my respect	excluded
Agreeableness - People are strange	included
Agreeableness - Politeness is phony	included
Conscientiousness - Conscientiousness gets ahead	included
Conscientiousness - Conscientiousness is good	excluded
Conscientiousness - I am responsible to other people	included
Conscientiousness - If I don't do it, it won't get done	excluded
Extraversion - I'm a good person	included
Extraversion - It's good to be wild	excluded
Extraversion - People are good	excluded
Extraversion - People are important	excluded
Extraversion - People will like me	included
Extraversion - Privacy is good	included
Neuroticism - Everything will be alright	excluded
Neuroticism - I am in control	included
Neuroticism - I blame myself	included
Neuroticism - I can control my thoughts	included
Neuroticism - I need help	included
Neuroticism - The world is dangerous	included
Neuroticism - There is a reason for things that happen	excluded
Neuroticism - Worrying is useful	excluded
Openness - Fantasy is good	included
Openness - I know all I need to know	included
Openness - It's good to be practical	excluded
Openness - It's good to think for yourself	excluded
Openness - Openness will improve me	excluded
Openness - Things are good as they are now	excluded
Openness - Unconventionality is bad	excluded
PBJW Personal Belief in a Just World Scale	
Just World	included
PBQ Personality Belief Questionnaire	
Antisocial	included
Avoidant	included
Borderline	included
Dependent	included
Histrionic	included
Narcissistic	included
Obsessive–Compulsive	included
Paranoid	included
Passive–Aggressive	included
Schizoid	included
PCBQ Positive Core Belief Questionnaire	

Positive Core Belief	included
PMBS Posttraumatic Maladaptive Beliefs Scale	
reliability and trustworthiness of others	included
self-worth and judgment	included
threat of harm	included
PSQ Positive Schema Questionnaire	
self-efficacy	included
success	included
trust	included
optimism	included
worthiness	included
PTCI Post Traumatic Cognition Inventory	
Negative Cognitions about the Self	included
world	included
Self-blame because of the event	excluded
RSES Rosenberg Self-Esteem Scale	
Self-Esteem	included
SBSA Self-Beliefs Related to Social Anxiety	
Excessively high standards for social performance	included
Unconditional beliefs about the self	included
Conditional beliefs concerning social evaluation	included
SCQ Self Concept Questionnaire	
Self-image	included
Academic	excluded
Social	included
Outcome	excluded
SCS Social Comparison Scale	
Social rank	included
Attractiveness	included
Judgements of group fit.	included
SDQ III Self-Description Questionnaire III	
Appearance	excluded
Emotional Stability	excluded
General Academic	excluded
General-Self	included
Honesty	excluded
Math	excluded
Physical Ability	excluded
Problem Solving	excluded
Relations With Opposite Sex	excluded
Relations With Parents	excluded
Relations With Same Sex	excluded
Religion/Spirituality	excluded
Verbal	excluded
SISE Single Items Self-Esteem	
self-esteem	included
STBS Social Thoughts and Beliefs Scale	
Social comparison	included

Social Ineptness	included
TABS Trauma and Attachment Belief Scale	
Self-Safety	included
Other-Safety	excluded
Self-Trust	included
Other-Trust	included
Self-Esteem	included
Other-Esteem	excluded
Self-Intimacy	excluded
TACQ - Type A Cognition Questionnaire	
Prove oneself through achievements	included
No universal moral principle exists	included
All resources are scarce	included
WAQ World Assumptions Questionnaire	
Controllability of Events	included
Trustworthiness and Goodness of People	excluded
Comprehensibility and Predictability of People	excluded
Safety and Vulnerability	included
WAS World Assumptions Scale	
Benevolence of the Impersonal World	excluded
Benevolence of the People	excluded
Meaningfulness Justice	excluded
Controllability	excluded
Randomness	excluded
Self-Worth	included
Self-controllability	excluded
Luck	included
YPSQ Young Positive Schema Questionnaire	
Emotional Fulfillment	included
Emotional Openness and Spontaneity	included
Empathic Consideration	included
Success	included
Healthy Boundaries / Developed Self	included
Healthy Self-Reliance / Competence	included
Healthy Self-Control / Self-Discipline	included
Healthy Self-Interest / Self-Care	included
Basic Health and Safety / Optimism	included
Realistic Expectations	included
Self-Directedness	included
Self-Compassion	included
Social Belonging	included
Stable Attachment	included
YSQ-S3 Young Schema Questionnaire	
Emotional Deprivation	included
Abandonment	included
Mistrust	included
Social Isolation / Alienation	included
Defectiveness / Unlovability	included

Failure to Achieve	included
Practical Incompetence/Dependence	included
Vulnerability to Harm or Illness	included
Enmeshment	included
Subjugation	included
Self-Sacrifice	included
Emotional Inhibition	included
Unrelenting Standards	included
Entitlement / Superiority	included
Insufficient Self-Control / Self-Discipline	included
Admiration/Recognition-Seeking	included
Pessimism / Worry	included
Self-Punitiveness	included

Supplemental Online Material 5: Bandwidth of existing models of core beliefs

The natural language processing approach in Study 2 on the items identified in the systematic review allowed for re-visiting research question 1 separately for each of the sources in Table 1 of the main manuscript. In particular, we estimated to what extent each of the 46 sources depicted in Table 1 is represented in the construct space defined by all sources. Therefore, we first estimated the embeddings for all items of the 46 measures. Next, separately for each measure and each nuance, the embeddings of the items pertaining to a particular measure were regressed on a nuance via multiple regression and adjusted R^2 served as estimator of explained variance. The average amount of variance explained across the 97 nuances is given in Supplemental Online Table S1.

Results show large differences between sources. Large average amount of variance (average adjusted $R^2 > .70$) was explained by the Assessment of Schema Adaptability Profile (ASAP) and the Personality Belief Items (PBI); both models have many dimensions and consider both positive as well as negative core beliefs. The Young Positive Schema Questionnaire (YPSQ) and the Young Schema Questionnaire (YSQ-S3) also explained large amount of variance in nuances (average adjusted R^2 of .68 and .79, respectively). In line with their conceptualization, the former mainly explains variance in positive nuances, the latter in negative nuances.

Models with very low amount of explained variance include the Social Comparison Scale (SCS) which assesses personal beliefs in relation to others (and, accordingly, shows some overlap with the nuance inferior); the Single Items Self-Esteem scale (SISE), which has only one item relating to self-esteem; and the Brief Suicide Cognition Scale (BSCS) which only relates to the nuance desperate (all average adjusted $R^2 \leq .20$).

Supplemental Online Table S1

Average amount of explained variance according to the CorBel-model for the 46 sources identified in Study 1

Name of the measure	Av. adj. R²
ABS2-SF Attitude and Belief Scale 2 - Short Version	.55
ASAP Assessment of Schema Adaptability Profile	.62
ATQ Automatic Thought Questionnaire	.48
BCSS Brief Core Belief Scale	.54
BSCS Brief Suicide Cognition Scale	.22
CBQ Core Belief Questionnaire	.40
CCL Beck Cognitive Checklist	.47
CCM-R Cognition Checklist for Mania—Revised	.56
CES-R Core Extrusion Schema—Revised	.36
CSE - Core Self Evaluation	.48
CSEI Coopersmith Self-Esteem Inventory	.69
CTI Cognitive Triad Inventory	.65
DAS-A Dysfunctional Attitude Scale	.67
EDBQ Eating Disorder Belief Questionnaire	.50
EBS Evaluative Belief Scale	.60
FMPS The Frost Multidimensional Perfectionism Scale	.59
GSE Generalized Self-Efficacy	.33
IBT Irrational Beliefs Test	.43
IoU Intolerance of uncertainty scale	.48
LoC Locus of Control	.53
LoC Locus of Control	.32
MIBS Maladaptive Interpersonal Beliefs Scale	.42
NCB Negative Core Beliefs Inventory	.66
NfC Need for control	.46
OBQ Obsessive Beliefs Questionnaire	.45
OFS Openness to the Future Scale	.37
PBI Personality Belief Items	.75
PBJW Personal Belief in a Just World Scale	.38
PBQ Personality Belief Questionnaire	.73
PCBQ Positive Core Belief Questionnaire	.52
PMBS Posttraumatic Maladaptive Beliefs Scale	.53
PSQ Positive Schema Questionnaire	.50
PTCI Post Traumatic Cognition Inventory	.58
RSES Rosenberg Self-Esteem Scale	.50
SBSA Self-Beliefs Related to Social Anxiety	.45
SCQ Self Concept Questionnaire	.41
SCS Social Comparison Scale	.12
SDQ III Self-Description Questionnaire III	.38
SISE Single Items Self-Esteem	.19
STBS Social Thoughts and Beliefs Scale	.42
TABS Trauma and Attachment Belief Scale	.41
TACQ - Type A Cognition Questionnaire	.34
WAQ World Assumptions Questionnaire	.50

WAS World Assumptions Scale	.60
YPSQ Young Positive Schema Questionnaire	.68
YSQ-S3 Young Schema Questionnaire	.79

Note. Av. adj. R^2 : Average adjusted explained variance.

Finally, some measures are very specific, thus relating to only a few nuances. As such, the Core Belief Questionnaire (CBQ) is only related to nuances incompetent and unworthy; the General Self-Efficacy scale (GSE) to nuances of the facet autonomous; the Intolerance of uncertainty scale (IoU) to nuances of the facet insecure; the Obsessive Beliefs Questionnaire (OBQ) to nuances of the facet unrelenting; the Personal Belief in a Just World Scale (PBJW) to nuances of the facet trusting; the Rosenberg Self-Esteem Scale (RSES) to nuances of the facet worthy; and the Type A Cognition Questionnaire (TACQ) to the nuances conditionally-worthy and selfish.

The results of this ancillary analyses can be interpreted as a benchmark to evaluate existing models regarding their coverage of the total construct space, with the CorBel model as a proxy for the latter. This also allows for a well-informed choice of a model and a corresponding measure according to a given use case.

Supplemental Online Material 8: Visualization of the three-factor structure representing domains on the residuals

To visualize the results of the exploratory factor analysis on the residuals according to (Saucier et al., 2001), we used network analysis with modularity analysis and multidimensional scaling. A modularity analysis on the network structure revealed a similar pattern as the three-factor exploratory factor analysis. For a resolution of 0.8 ($Q = .20$), modularity analysis suggested three clusters which reflected the three domains Self-Esteem, Agency, and Communion. To graphically illustrate the results, we ran a two-dimensional multidimensional scaling on the matrix of correlations between the nuances converted to distances. Results are depicted in Figure S1. Position of the nuances are according to the results of multidimensional scaling. Color of the nuances reflects the clustering of modularity analysis. Lines represent the results of exploratory factor analysis by weighting the coordinates of the nuances by their factor loading on the three factors. Results show that nuances relating to the three domains self-esteem, agency, and communion can be clearly distinguished.

Figure S1:

Results from factor (lines) and network (dots) analysis for a three-factor/cluster solution.

Colors are chosen according to modularity analysis. Position of the items according to a two-dimensional multidimensional scaling.

**Supplemental Online Material 9: Model fit for confirmatory factor analysis separately
for the twenty facets in Study 3**

Note: N. par: Number of parameters.

Note that facets with only two nuances cannot be tested due to zero degrees of freedom.

However, the two nuances within each of these facets showed high correlations (Admired: .69, Competent: .68, Moderate: .55, Pessimistic: .77).
