

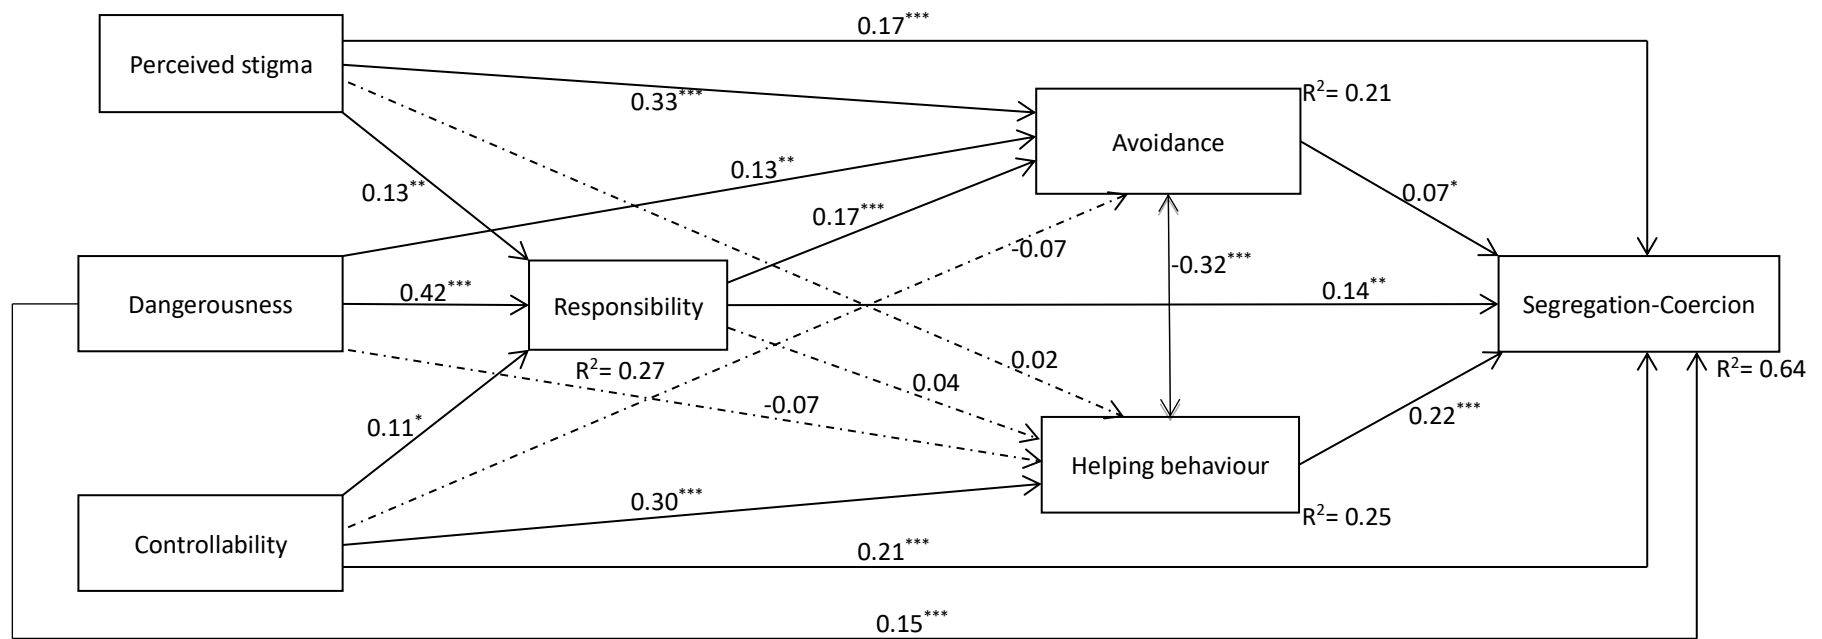

Figure S1. Path model of perceived stigma and stigmatising attitudes as predictors of the endorsement of segregation-coercion among Chinese healthcare professionals, controlling for age, gender, education level, years of work experience, familiarity with AUDs in significant others, mental health background, and alcohol consumption.

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$. Significant and non-significant standardised coefficients are displayed in solid and dashed lines, respectively.
