Note. R^2 = Nagelkerke R^2. GPA = cumulative graduate grade point average. For GPA, odds ratios and confidence intervals are expressed per 0.01 GPA increase (rather than per 1.0 unit) because of the restricted range and ceiling effects in the data. For other predictors, odds ratios are reported in their original measurement units. In cases of sparse data or quasi-complete separation (i.e., the predictor nearly perfectly distinguished between outcomes), coefficients may become unstable, producing extremely wide confidence intervals. In such cases, lower bounds may round to 0, upper bounds may be shown as Not estimable, and very small log-odds values may cause the lower bound to display close to 1. Selective models include only predictors with significant point-biserial correlations within setting.
